

Abstract

To be written.

This MMSC thesis will further explore general kernel spectral methods for finding equilibrium measures where initial progress made in [Gutleb, Carrillo and S. Olver 2020](#) and [Gutleb, Carrillo and S. Olver 2021](#).

Keywords: Equilibrium Measures

Languages: C++, Julia, Python

Chapter 1

Introduction

Let \mathbb{N} denote the natural numbers (positive integers) without 0 and let $\mathbb{N}_0 := \mathbb{N} \cup \{0\}$. In the following, we will use **bold** notation for vectors, matrices will generally be denoted by a capital letter and scalars by a lowercase letter. We will frequently make use of the (Euclidean) 2-norm of a vector, as denoted by $\|\cdot\|_2$. So for a d -dimensional vector $\mathbf{x} \in \mathbb{R}^d$ we have $\|\mathbf{x}\|_2 := \sqrt{\sum_{k=1}^d x_k^2}$.

One should also clarify the nature of a few of the integrals appearing in this thesis which are often performed over the closed unit ball $B_1(\mathbf{x}) := \{\mathbf{y} \in \mathbb{R}^d \mid \|\mathbf{x} - \mathbf{y}\|_2 \leq 1\}$ centered at the origin $\mathbf{x} = \mathbf{0}$. These volume integrals (often ended by $d^d y$ or dV) over the d -dimensional unit ball shall be written as

$$\int_{B_1(\mathbf{0})} d\mathbf{y},$$

where $\mathbf{y} \in \mathbb{R}^d$ is the integration variable. Note that some definitions of $B_1(\mathbf{x})$ are open sets, leaving out the shell $\{\mathbf{y} \in \mathbb{R}^d \mid \|\mathbf{x} - \mathbf{y}\|_2 = 1\}$. The choice of definition does not matter for our purposes as the shell, a hyperplane of Lebesgue measure 0, does not contribute to the integral.

(a) $N = 8$ particles interacting with one another (b) Plot of attractive-repulsive potential functions through the potential $K(r)$.
 $K(r) = \frac{r^\alpha}{\alpha} - \frac{r^\beta}{\beta}$ for different α, β .

Cf. Figure 1.1a and Figure 1.1b.

All plots and figures in this thesis were generated using the Makie visualisation tool (Danisch and Krumbiegel 2021), an open-source package available for the Julia computing language (Bezanson et al. 2017).

Just Notes

This chapter's purpose is the collection of notes, and it will not be included in the final dissertation.

Special Functions we like

Pochhammer's falling symbol $(x)_n := \prod_{k=0}^{n-1} (x - k)$.

Pochhammer's rising symbol $(x)^n := \prod_{k=0}^{n-1} (x + k)$.

Generalised hypergeometric series

$${}_pF_q(a_1, \dots, a_p; b_1, \dots, b_q; z) := \sum_{n=0}^{\infty} \frac{(a_1)_n \cdots (a_p)_n}{(b_1)_n \cdots (b_q)_n} \frac{z^n}{n!} \cdot$$

(Gaussian) Hypergeometric function

$${}_2F_1(a, -n; c; z) = \sum_{j=0}^n (-1)^j \binom{n}{j} \frac{(a)_j}{(c)_j} z^j.$$

(A special case of the hypergeometric series with $p = 2$, $q = 1$).

Jacobi (=hypergeometric) polynomials

$$P_n^{(\alpha, \beta)}(z) := \frac{(\alpha + 1)_n}{n!} {}_2F_1\left(-n, 1 + \alpha + \beta + n; \alpha + 1; \frac{1}{2}(1 - z)\right).$$

Gegenbauer (=ultraspherical) polynomials

$$C_n^{(\lambda)}(z) := \frac{(2\lambda)_n}{n!} {}_2F_1\left(-n, 2\lambda + n; \lambda + \frac{1}{2}; \frac{1 - z}{2}\right) = \frac{(2\lambda)_n}{(\lambda + \frac{1}{2})_n} P_n^{(\lambda-1/2, \lambda-1/2)}(x).$$

They satisfy a three-term recurrence relation (as all orthogonal polynomials do!)

$$\begin{aligned} C_0^{(\lambda)}(x) &= 1 \\ C_1^{(\lambda)}(x) &= 2\lambda x \\ (n+1)C_{n+1}^{(\lambda)}(x) &= 2(n+\lambda)x C_n^{(\lambda)}(x) - (n+2\lambda-1)C_{n-1}^{(\lambda)}(x). \end{aligned}$$

From Wikipedia: In spectral methods for solving differential equations, if a function is expanded in the basis of Chebyshev polynomials and its derivative is represented in a Gegenbauer/ultraspherical basis, then the derivative operator becomes a diagonal matrix, leading to fast banded matrix methods for large problems (S. Olver and Townsend 2013).

Three-term recurrence relationship F. Olver et al. 2018, p. 18.9.1:

$$xC_n^{(\lambda)}(x) = \frac{(n+2\lambda-1)}{2(n+\lambda)}C_{n-1}^{(\lambda)}(x) + \frac{n+1}{2(n+\lambda)}C_{n+1}^{(\lambda)}(x). \quad (1.1)$$

1.0.1 Theorem: Two term recurrence of Q^α

The integral operator

$$Q^\alpha[u](x) = \int_{-1}^1 |x-y|^\alpha u(y) dy$$

satisfies a two-term recurrence relationship when acting on the ultraspherical polynomials $C_n^{(\lambda)}(y)$ with weight $w(y) = (1-y^2)^{\lambda-\frac{1}{2}}$ such that

$$xQ^\alpha[wC_n^{(\lambda)}](x) = \kappa_1 Q^\alpha[wC_{n-1}^{(\lambda)}](x) + \kappa_2 Q^\alpha[wC_{n+1}^{(\lambda)}](x),$$

where $n \geq 2$ and with the constants

$$\begin{aligned} \kappa_1 &= \frac{(n-\alpha-1)(2\lambda+n-1)}{2n(\lambda+n)}, \\ \kappa_2 &= \frac{(n+1)(2\lambda+n+\alpha+1)}{2(\lambda+n)(2\lambda+n)}. \end{aligned}$$

Chapter 2

Particle Interaction Theory

Some input from the Wolfson Particle Physicist: Lennard-Jones is an **intermolecular** potential. So length-scale is between-molecules. Therefore, the only relevant interaction is the electromagnetic one. The strong force keeps protons in the nucleus together (a force much stronger than the electromagnetic one).

2.0.1 Structure

- Definition: N-Body System (set of particles with position and velocity)
- Inertia / kinetic energy
- [[Potential]]s motivating a force $F = -\nabla U$
- Write differential equation of movement $\frac{dx_i}{dt}$
- Link to [[Particle Simulator]], give a Screenshot
- Introduce [[Continuous Limit]], write about particle density $\rho(x)$
- [[Friction Term]] -> Energy Dissipation -> Different Plot

Chapter 3

Particle Simulator

is there to solve problems in [[Particle Interaction Theory]].

3.0.1 Structure

- Talk about different integration methods
- Leap-Frog Integration
- Screenshot of GUI

3.0.2 Available Methods:

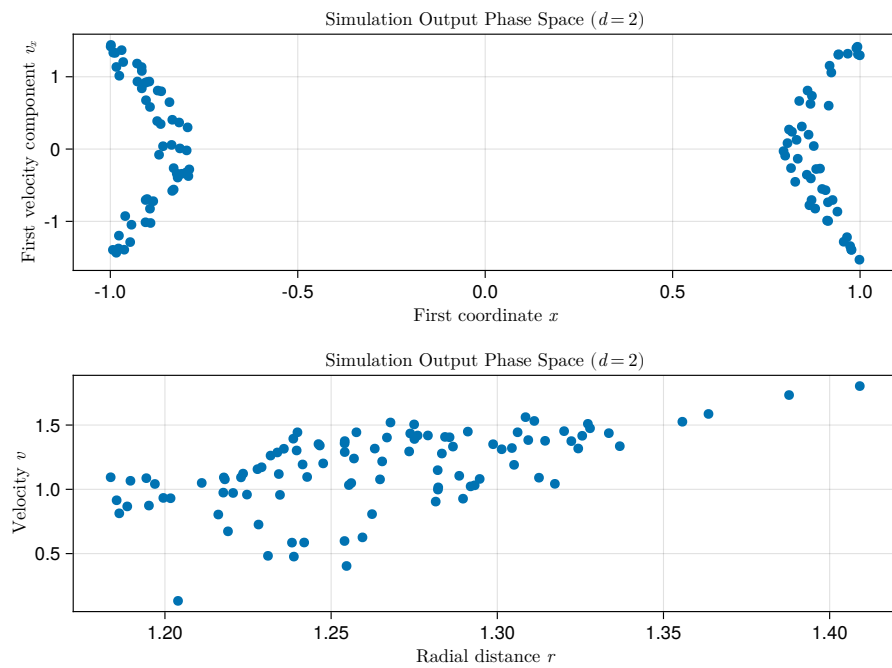

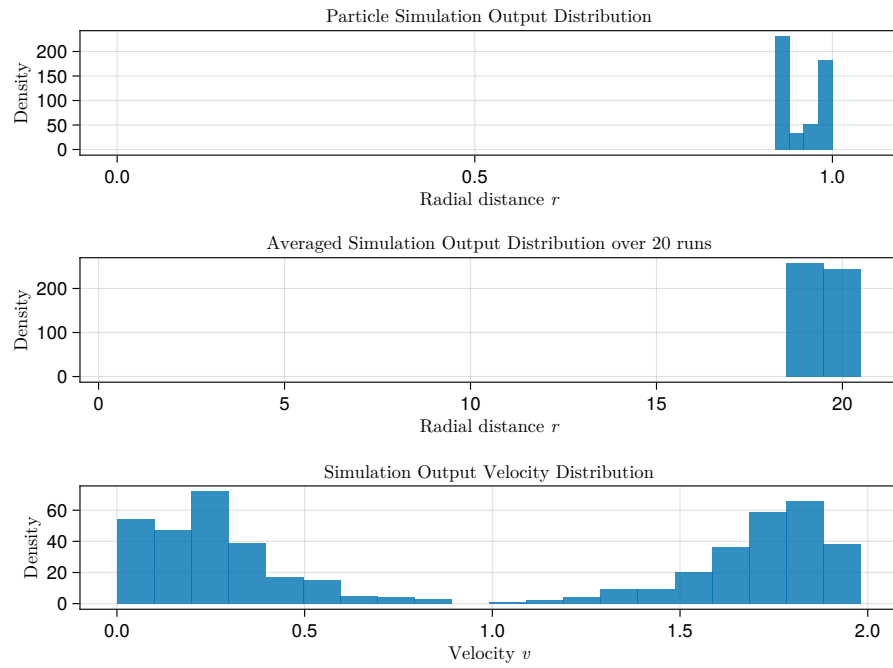

Figure 3.3: Position and velocity of particles in the simulation visualised as a phase space plot.

**Figure 3.4:** Position Histogram

Chapter 4

Spectral Method

4.1 Content

solves an [[Integral Equation]] or [[Differential Equation]] by assuming a solution of the form

$$\rho(x) = \sum_{k=1}^N \rho_k b_k(x)$$

where $\{b_k\}$ is a basis of functions.

4.1.1 Structure

- Introduce [[Chebyshev Polynomials]], [[Gegenbauer Polynomials|Ultraspherical Polynomials]], [[Jacobi Polynomials]], etc.
- Describe the method
- Talk about the resulting [[Operator]].
 - [[Derivation of In-Operator Recurrence]]
- Numerical Analysis ([[Bound on the Error]])
- Show results here? Or in extra results chapter?

4.2 Definitions

4.2.1 Definition: Ansatz

$$\rho(\mathbf{x}) = \left(1 - \|\mathbf{x}\|_2^2\right)^{m - \frac{\alpha+d}{2}} \sum_{k=1}^N P_k^{(a,b)}(2\|\mathbf{x}\|_2^2 - 1)$$

4.2.2 Definition: Bound on the Error

- [] How does one look at this topic? We should have [[Spectral Convergence]], hopefully.

4.2.3 Definition: Chebyshev Polynomials

Of the first kind:

$$T_k(x)$$

Of the second kind:

$$U_k(x)$$

Also have a [[Three-Term Recurrence Relationship]].

Based on the Three-Term Recurrence Relationship (cf. Definition 4.2.16).

One can even determine an explicit relationship between the coefficients in the Jacobi expansion by considering the Jacobi Matrix (cf. Definition 4.2.10).

Considering the operator $\hat{Q}^\beta[\rho]$ as in Theorem 4.2.1, from the ansatz $\rho(\mathbf{x})$ (cf. Definition 4.2.1) we have

$$\hat{Q}^\beta(x) = \sum_{k=0}^{N-1} \rho_k \int_{B_1(\mathbf{0})} \|\mathbf{x} - \mathbf{y}\|_2^\beta (1 - \|\mathbf{y}\|_2^2)^a P_k^{(a,b)}(2\|\mathbf{y}\|_2^2 - 1) d\mathbf{y}. \quad (4.1)$$

We are now interested in a numerical representation of the operator \hat{Q}^β acting on the function $\rho \in L^2$, so an equivalent (linear) operator $Q^\beta : \mathbb{R}^N \mapsto \mathbb{R}^N$ acting on the coefficients $\rho_k \in \mathbb{R}$, $k = 1, \dots, N$. As every finite-dimensional linear operator must have a matrix representation, we are looking for a $Q^\beta \in \mathbb{R}^{N \times N}$ such that

$$\hat{Q}^\beta[\rho](\mathbf{x}) = \mathbf{P}_k^{(a,b)}(2\|\mathbf{x}\|_2^2 - 1) \cdot Q^\beta \boldsymbol{\rho},$$

where $\mathbf{P}_k^{(a,b)}(2\|\mathbf{x}\|_2^2 - 1) \in \mathbb{R}^N$ is the vector of Jacobi polynomials $P_0^{(a,b)}(x)$, $P_1^{(a,b)}(x)$, ..., $P_{N-1}^{(a,b)}(x)$ evaluated at $2\|\mathbf{x}\|_2^2 - 1$ as introduced in and after Definition 4.2.11.

Therefore, starting from Equation (4.2), we obtain

$$\begin{aligned} \hat{Q}^\beta[\rho](\mathbf{x}) &= \sum_{k=0}^{N-1} \rho_k \hat{Q}^\beta[wP_k](\mathbf{x}) = \sum_{k=0}^{N-1} \rho_k \sum_{j=0}^{N-1} q_{kj} P_k^{(a,b)}(2\|\mathbf{x}\|_2^2 - 1) \\ &= \sum_{j=0}^{N-1} \sum_{k=0}^{N-1} \rho_k q_{kj} P_k^{(a,b)}(2\|\mathbf{x}\|_2^2 - 1), \end{aligned}$$

which we will rewrite in matrix-form,

$$\begin{aligned} \hat{Q}^\beta[\rho](\mathbf{x}) &= \mathbf{P}(\mathbf{x}) \cdot \begin{pmatrix} \sum_{k=0}^{N-1} \rho_k q_{k,1} \\ \vdots \\ \sum_{k=0}^{N-1} \rho_k q_{k,N} \end{pmatrix} = \mathbf{P}(\mathbf{x}) \cdot \underbrace{\begin{pmatrix} q_{11} & \dots & q_{1N} \\ \vdots & \ddots & \vdots \\ q_{N1} & \dots & q_{NN} \end{pmatrix}}_{=: Q^\beta} \begin{pmatrix} \rho_0 \\ \vdots \\ \rho_{N-1} \end{pmatrix} \\ &= \mathbf{P}_k^{(a,b)}(2\|\mathbf{x}\|_2^2 - 1) \cdot Q^\beta \boldsymbol{\rho} \end{aligned}$$

where we used $\mathbf{P}(\mathbf{x}) = \mathbf{P}_k^{(a,b)}(2\|\mathbf{x}\|_2^2 - 1)$ as a shorthand giving us the form of the operator matrix. Each value q_{kj} in it is therefore chosen to satisfy

4.2.4 Definition: Equilibrium Measures

Are a Measure (cf. ??)

$$\rho : \mathbb{R} \mapsto \mathbb{R}, \rho(x)$$

- [] Need to fix this definition Can be computed using [EquilibriumMeasures.jl](#)

4.2.5 Definition: Function Space

To be defined, but the space our coefficients are in. Could be

$$L^2 := \{f : \mathbb{R} \mapsto \mathbb{R} | f \text{ square integrable?}\}$$

4.2.6 Definition: Gaussian Hypergeometric Function

Written as

$${}_2F_1(a, b; c; z)$$

4.2.7 Definition: Gegenbauer Polynomials

alias: Ultraspherical Polynomials

Are a special case of the Jacobi Polynomials (cf. Definition 4.2.11) and form an Orthonormal Basis (cf. ??) under the weight given by

$$w(x) = (1 + x)^\alpha$$

4.2.8 Definition: Generalised Hypergeometric Series

Is given by

$${}_pF_q$$

Special Case: [[Gaussian Hypergeometric Function]]. The definition involves the Rising Factorial (cf. Definition 4.2.14) (Pochhammer Symbol).

4.2.9 Definition: Integration Routine

Could be done using [Cubature](#). Otherwise, just Forward Euler.

4.2.10 Definition: Jacobi Matrix

aliases: Jacobi Operator

The **Jacobi operator** is the matrix $X \in \mathbb{R}^{N \times N}$ satisfying

$$x \cdot P(x) = P(x) \cdot X^T$$

4.2.11 Definition: Jacobi Polynomials

Let $P^{(a,b)} : \mathbb{C} \mapsto \mathbb{C}$ with

$$P_n^{(a,b)}(x) = \frac{(a+1)_n}{n!} {}_2F_1\left(-n, 1+a+b+n; a+1; \frac{1}{2}(1-x)\right)$$

So are defined using the Gaussian Hypergeometric Function (cf. Definition 4.2.6) and the Pochhammer symbol. Which is equivalent to

$$P_n^{(a,b)}(x) = \frac{\Gamma(a+n+1)}{n! \Gamma(a+b+n+1)} \sum_{m=0}^n \binom{n}{m} \frac{\Gamma(a+b+n+m+1)}{\Gamma(a+m+1)} \left(\frac{x-1}{2}\right)^m.$$

where $\Gamma(x) = \int_0^\infty t^{x-1} e^{-t} dt$ (with $\Re(x) > 0$) is the gamma function ¹.

Gegenbauer Polynomials (cf. Definition 4.2.7) are a special case. And Chebyshev Polynomials (cf. Definition 4.2.3) are a special case of them.

Following from this definition,

$$\begin{aligned} P_0^{(a,b)}(x) &= 1 \\ P_1^{(a,b)}(x) &= (a+1) + (a+b+2) \frac{x-1}{2} \end{aligned}$$

and so on. Note that obviously, $\deg(P_k^{(a,b)}) = k$.

4.2.1 Nice Spectral Properties

- Differentiation
- Three-Term Recurrence
- why are they better than just Chebyshev?

Note that in this manuscript we will use the dot-product notation

$$f(x) = \sum_{k=0}^{N-1} f_k P_k^{(a,b)}(x) \quad \Leftrightarrow \quad f(x) = \mathbf{f} \cdot \mathbf{P}^{(a,b)}(x),$$

¹Recall that for integer arguments $k \in \mathbb{N}$, it equals the factorial of $(k-1)$ so $\Gamma(k) = (k-1)!$.

to express that a function f is a linear combination of basis polynomials with coefficients $\mathbf{f} = (f_0, \dots, f_{N-1})^T \in \mathbb{R}^N$. So $\mathbf{P}^{(a,b)}(x) \in \mathbb{R}^N$ is the vector of Jacobi polynomials $P_0^{(a,b)}(x), P_1^{(a,b)}(x), \dots, P_{N-1}^{(a,b)}(x)$.

Figure 4.1: Convergence of Jacobi polynomial expansion. Convergence speed according to theory is: TODO.

4.2.12 Definition: Operator

Either the attractive or the repulsive operator can be sparse.

Obtained using [[Theorem 2.16]]. Derivation of the exact row/column form on paper (#include in My Dissertation (cf. ??))

- [] What does the solver look like for other kernels?

4.2.13 Definition: Orthogonal Polynomials

Are univariate polynomials

$$p : \mathbb{R} \mapsto \mathbb{R}, p(x) = \sum_{k=1}^N c_k x^k.$$

that form an Orthonormal Basis (cf. ??) under some inner product.

4.2.14 Definition: Rising Factorial

alias: Pochhammer Symbol

Given by

$$(x)_n = \prod_{k=0}^{n-1} (x + k).$$

4.2.15 Definition: Spectral Convergence

Definition 3.6 (Convergence at spectral speed) An N -point approximation φ_N of a function f converges to f at spectral speed if $|\varphi_N - f|$ decays pointwise in $[-1, 1]$ faster than $O(N^{-p})$ for any $p = 1, 2, \dots$ so $p \in \mathbb{N}$.

Source: https://www.damtp.cam.ac.uk/user/cbs31/Teaching_files/c11.pdf.

4.2.16 Definition: Three-Term Recurrence Relationship

All Orthogonal Polynomials (cf. Definition 4.2.13) have (at least) a three-term recurrence relationship.

- [] how could I prove that?

4.2.1 Theorem: Integration Theorem that needs a name

On the d -dimensional unit ball B_1 the power law potential, with power $\alpha \in (-d, 2 + 2m - d)$, $m \in \mathbb{N}_0$ and $\beta > -d$, of the n -th weighted radial Jacobi polynomial

$$(1 - |y|^2)^{m - \frac{\alpha+d}{2}} P_n^{(m - \frac{\alpha+d}{2}, \frac{d-2}{2})}(2|y|^2 - 1)$$

reduces to a Gaussian hypergeometric function as follows:

$$\begin{aligned} & \int_{B_1} |x - y|^\beta (1 - |y|^2)^{m - \frac{\alpha+d}{2}} P_n^{(m - \frac{\alpha+d}{2}, \frac{d-2}{2})}(2|y|^2 - 1) dy \\ &= \frac{\pi^{d/2} \Gamma(1 + \frac{\beta}{2}) \Gamma(\frac{\beta+d}{2}) \Gamma(m+n - \frac{\alpha+d}{2} + 1)}{\Gamma(\frac{d}{2}) \Gamma(n+1) \Gamma(\frac{\beta}{2} - n + 1) \Gamma(\frac{\beta-\alpha}{2} + m+n+1)} {}_2F_1 \left(n - \frac{\beta}{2}, -m - n + \frac{\alpha-\beta}{2}; \frac{d}{2}; |x|^2 \right). \end{aligned}$$

Theorem 4.2.1 gives an explicit expression for the main integral $Q^\beta : L \mapsto L$, an operator from the Function Space L to the function space L , we are interested in:

$$\hat{Q}^\beta[\rho](x) = \int_{B_1} |x - y|^\beta (1 - |y|^2)^{m - \frac{\alpha+d}{2}} P_n^{(m - \frac{\alpha+d}{2}, \frac{d-2}{2})}(2|y|^2 - 1) dy$$

which is used to construct the Spectral Method Operator Q^β (cf. Definition 4.2.12), acting on the coefficients ρ .

4.3 Derivation of Operator

Based on the Three-Term Recurrence Relationship (cf. Definition 4.2.16).

One can even determine an explicit relationship between the coefficients in the Jacobi expansion by considering the Jacobi Matrix (cf. Definition 4.2.10).

Considering the operator $\hat{Q}^\beta[\rho]$ as in Theorem 4.2.1, from the ansatz $\rho(\mathbf{x})$ (cf. Definition 4.2.1) we have

$$\hat{Q}^\beta(x) = \sum_{k=0}^{N-1} \rho_k \int_{B_1(\mathbf{0})} \|\mathbf{x} - \mathbf{y}\|_2^\beta (1 - \|\mathbf{y}\|_2^2)^a P_k^{(a,b)} (2 \|\mathbf{y}\|_2^2 - 1) d\mathbf{y}. \quad (4.2)$$

We are now interested in a numerical representation of the operator \hat{Q}^β acting on the function $\rho \in L^2$, so an equivalent (linear) operator $Q^\beta : \mathbb{R}^N \mapsto \mathbb{R}^N$ acting on the coefficients $\rho_k \in \mathbb{R}$, $k = 1, \dots, N$. As every finite-dimensional linear operator must have a matrix representation, we are looking for a $Q^\beta \in \mathbb{R}^{N \times N}$ such that

$$\hat{Q}^\beta[\rho](\mathbf{x}) = \mathbf{P}_k^{(a,b)} (2 \|\mathbf{x}\|_2^2 - 1) \cdot Q^\beta \boldsymbol{\rho},$$

where $\mathbf{P}_k^{(a,b)} (2 \|\mathbf{x}\|_2^2 - 1) \in \mathbb{R}^N$ is the vector of Jacobi polynomials $P_0^{(a,b)}(x)$, $P_1^{(a,b)}(x)$, ..., $P_{N-1}^{(a,b)}(x)$ evaluated at $2 \|\mathbf{x}\|_2^2 - 1$ as introduced in and after Definition 4.2.11.

Therefore, starting from Equation (4.2), we obtain

$$\begin{aligned} \hat{Q}^\beta[\rho](\mathbf{x}) &= \sum_{k=0}^{N-1} \rho_k \hat{Q}^\beta[wP_k](\mathbf{x}) = \sum_{k=0}^{N-1} \rho_k \sum_{j=0}^{N-1} q_{kj} P_k^{(a,b)} (2 \|\mathbf{x}\|_2^2 - 1) \\ &= \sum_{j=0}^{N-1} \sum_{k=0}^{N-1} \rho_k q_{kj} P_k^{(a,b)} (2 \|\mathbf{x}\|_2^2 - 1), \end{aligned}$$

which we will rewrite in matrix-form,

$$\begin{aligned} \hat{Q}^\beta[\rho](\mathbf{x}) &= \mathbf{P}(\mathbf{x}) \cdot \begin{pmatrix} \sum_{k=0}^{N-1} \rho_k q_{k,1} \\ \vdots \\ \sum_{k=0}^{N-1} \rho_k q_{k,N} \end{pmatrix} = \mathbf{P}(\mathbf{x}) \cdot \underbrace{\begin{pmatrix} q_{11} & \dots & q_{1N} \\ \vdots & \ddots & \vdots \\ q_{N1} & \dots & q_{NN} \end{pmatrix}}_{=: Q^\beta} \begin{pmatrix} \rho_0 \\ \vdots \\ \rho_{N-1} \end{pmatrix} \\ &= \mathbf{P}_k^{(a,b)} (2 \|\mathbf{x}\|_2^2 - 1) \cdot Q^\beta \boldsymbol{\rho} \end{aligned}$$

where we used $\mathbf{P}(\mathbf{x}) = \mathbf{P}_k^{(a,b)} (2 \|\mathbf{x}\|_2^2 - 1)$ as a shorthand giving us the form of the operator matrix. Each value q_{kj} in it is therefore chosen to satisfy

List of Figures and Tables

List of Figures

| | | |
|-----|--|----|
| 3.1 | Screenshot of the GUI | 10 |
| 3.2 | Position and velocity of particles in the simulation. | 11 |
| 3.3 | Position and velocity of particles in the simulation visualised as a phase space plot. | 11 |
| 3.4 | Position Histogram | 12 |
| 4.1 | Convergence of Jacobi polynomial expansion. Convergence speed according to theory is: TODO. | 18 |
| 4.2 | The attractive and repulsive operators (matrices), values are in log10-scale. | 22 |
| 4.3 | Solutions of increasing orders | 22 |
| 4.4 | Outer Optimisation | 23 |
| 4.5 | Analytic solution and comparison to numerical solutions | 24 |
| 4.6 | Convergence to analytic solutions | 25 |
| 4.7 | Convergence | 25 |
| 4.8 | Spatial energy dependence on r | 26 |
| 4.9 | Varying parameters in the solver | 27 |
| 6.1 | Comparison of the radial distance histogram from the simulation output with the solvers equilibrium measure ρ | 29 |
